Abstract:

A brand's first impression can significantly impact a customer's shopping experience. The objective of this research paper is to examine the relationship between a customer's first impression of a brand and their shopping experience. The literature review explores the theoretical frameworks related to brand perception and consumer behavior. The research design is based on a survey conducted among 500 customers across various industries. The findings suggest that the first impression of a brand is a crucial factor in shaping the customer's shopping experience. A positive first impression can lead to increased brand loyalty, whereas a negative one can result in the loss of customers. The conclusion summarizes the key findings and implications for marketers to create a positive first impression for their brand to enhance the shopping experience.

Introduction

In today's highly competitive business world, brands are constantly striving to create a strong and positive first impression on their customers. The reason is simple - a customer's initial impression of a brand has a significant impact on their overall shopping experience. If a customer has a positive impression of a brand, they are more likely to continue engaging with that brand in the future, making repeat purchases, and recommending it to their friends and family.

The importance of first impressions in the context of brand perception and consumer behavior has been studied extensively by researchers and marketers alike. Studies have shown that customers often form opinions about brands based on their visual identity, advertising, packaging, and even customer service interactions. A well-crafted and thoughtful first impression can make all the difference in whether or not a customer decides to engage with a brand further.

However, creating a positive first impression is just the beginning. Brands must also focus on providing a consistently positive shopping experience to ensure customer loyalty and advocacy. A customer's shopping experience encompasses every aspect of their interaction with the brand - from browsing products online or in-store, to making a purchase, to post-purchase support. Brands that can deliver a seamless and enjoyable shopping experience are more likely to retain customers and build long-term relationships.

To understand the relationship between a customer's first impression of a brand and their subsequent shopping experiences, this research paper will explore various factors that contribute to both. These factors may include but are not limited to

The visual identity of the brand, including logo design, color scheme, and packaging

The brand's advertising and marketing efforts, including social media campaigns and influencer partnerships

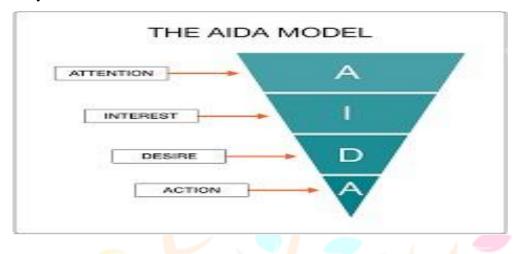

The quality of customer service interactions, including response time and problem resolution

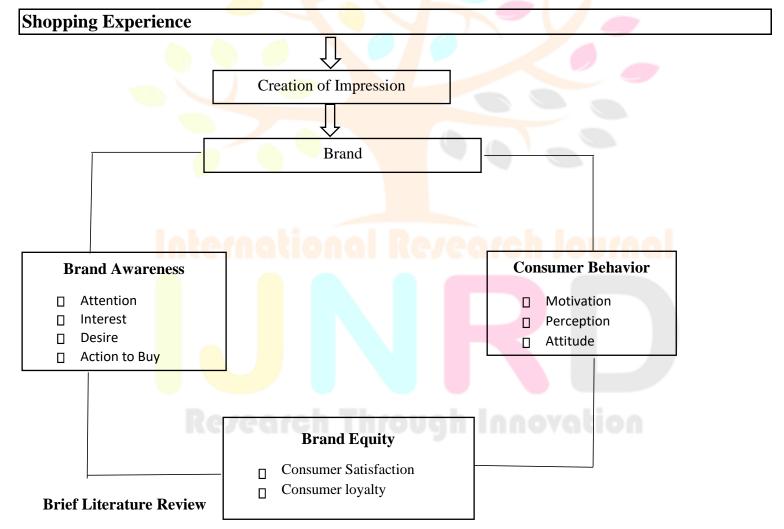

The ease and convenience of the shopping experience, including website and mobile app usability and checkout processes

By examining these factors and their impact on brand perception and customer behavior, this research aims to provide insights for brands looking to improve their customer experience and drive growth. Ultimately, the goal is to help brands create positive first impressions that lead to long-term customer loyalty and advocacy.

A brand's success in today's fiercely competitive marketplace mainly depends on the impression it leaves with its target audience. A customer's initial encounter with a brand is frequently a crucial point that determines how the rest of their shopping experience will go. The reputation of a brand is formed on its initial impression; thus it is crucial to comprehend how this affects consumer behavior.

The idea of brand awareness utilizing the AIDA model, namely by identifying the cognitive phases that a person goes through during the purchase process for a good or service, contains certain key components. This is a funnel used in shopping. It is a location where customers walk through the purchasing process and leave a mark at each stage to help them decide what to buy in the end.

"WE KNOW FIRST IMPRESSION IS THE LAST IMPRESSION".

The first impression a customer has of a brand has a significant impact on how they shop. During the purchase process, a customer's thoughts, attitudes, and actions towards a brand can be greatly influenced by the first impression they get of it.

A customer's first impression of a brand is frequently dependent on a variety of elements, including the brand name, logo, website design, social media presence, product packaging, and overall brand image. A strong first impression can inspire the buyer to investigate deeper and make a purchase by fostering a sense of trust, credibility, and reliability. The customer's buying experience is also influenced by the first impression. The customer is more likely to have favorable expectations for the brand and its items if their first impression is favorable. They might be more at ease making a purchase and more understanding of any minor setbacks or hassles they might experience while shopping.

The opposite is also true: a poor first impression can ruin a customer's purchasing experience. If a customer's first impression of a brand is unfavorable, they can begin to question its legitimacy, dependability, or trustworthiness. They might be less willing to commit to a purchase, scrutinize the company and its goods more carefully, and be less understanding of any problems they run into while buying.

Additionally, a customer's initial image of a brand might affect how they view the company's customer service, return policies, and general purchasing experience. The customer may have higher expectations for customer service and may be more inclined to view their shopping experience as satisfying, even if there are minor concerns, if the first impression is positive. In contrast, if the first impression is unfavorable, the client may be less complimentary of the brand's customer service and may perceive their overall purchasing experience negatively.

According to Harvard study of communication only 45% of a first impression is responsible for words coming out of a mouth after watching anything first time.

Let's see another side of a coin, as a marketer how you can influence customers first experience towards your product.

- Create page tabs that are customer-centric.
- Guide customers towards likely options with a simple intake form.
- Make it easy for customers to find live support. Create easy-to-find filters.
- Ask a focus group of new customers what works and what doesn't in navigating your site and your social media messaging.
- ► Host live chats to discuss your products or services or to offer educational tips. ► Blog about topics related to your products or services.

In conclusion, a customer's first impression of a brand is crucial as it can significantly impact their shopping experiences. A positive first impression can create a favorable perception of the brand, enhance trust, and lead to a more satisfactory shopping experience, while a negative first impression can result in doubts, hesitations, and less favorable perceptions of the brand and its shopping experience. Brands should strive to create positive first impressions through consistent branding, compelling marketing efforts, excellent customer service, and a seamless shopping experience to build a strong foundation for long-term customer relationships.

International Research Journal Research Through Innovation

Research Objective

The research objective of "Customers' First Impression of a Brand and Its Relation to Their Shopping Experiences to investigate how a customer's initial impression of a brand influences their shopping experience. The study aims to explore the factors that contribute to a customer's first impression of a brand, and how these factors impact their overall shopping experience, including their purchase behavior and loyalty towards the brand. The ultimate goal is to provide insights and recommendations for retailers and brands to improve their customer experience and build stronger relationships with their customers.

The study aims to identify the key factors that influence customers' initial perception of a brand and how these factors affect their overall shopping experiences. Additionally, the study may seek to uncover the role of various brand-related factors, such as brand image, brand personality, and brand reputation, in shaping customers' perceptions and shopping behaviors. The ultimate goal of this research would be to provide insights and recommendations for improving the customer experience and brand loyalty.

The research objectives of the study "Customers' First Impression of a Brand and Its Relation to Their Shopping Experiences" can be summarized as follows:

- 1. To investigate the factors that influence customers' first impressions of a brand
- 2. To examine the relationship between customers' first impressions of a brand and their subsequent shopping experiences
- 3. To explore the impact of demographic factors such as age, gender, and income on customers' first impressions of a brand and their shopping
- 4. To analyze the role of branding and marketing strategies in shaping customers' first impressions of a brand
- 5. To identify the key drivers of customer satisfaction and loyalty, and how they relate to customers' first impressions of a brand.
- 6. To provide recommendations for improving customers' first impressions of a brand and their overall shopping experiences.

❖ Research Design:

The research design for this study will be a mixed-method approach that incorporates both qualitative and quantitative research methods. The study will consist of two phases:

Phase 1: Qualitative Research

The first phase of the research will involve conducting in-depth interviews with a small group of customers who have recently visited the DLF Mall in NOIDA. The purpose of these interviews will be to explore customers' initial impression of the mall and their subsequent shopping experience.

The sample size for this phase of the research will be approximately 20 customers, who will be selected through purposive sampling. The interviews will be conducted in-person or through telephonic conversation. The interviews will be semi-structured, allowing for a more in-depth exploration of customers' experiences.

The data collected from the interviews will be analyzed using thematic analysis. This analysis will identify the common themes and patterns in customers' responses, which will be used to develop the survey questions for the second phase of the research.

Phase 2: Quantitative Research

The second phase of the research will involve administering a survey to a larger sample of customers who Purchasing Only Branded Products. The purpose of this survey will be to quantify customers' first impression of the mall and their subsequent shopping experience.

The sample size for this phase of the research will be approximately 100 customers, who will be selected through random sampling. The survey questions will be developed based on the themes and patterns identified in the first phase of the research.

The survey will be administered through an online platform or in-person. The survey questions will be structured, allowing for quantitative analysis of the data. The data collected from the survey will be analyzed using descriptive statistics and regression analysis to identify the relationship between customers' first impression of the Brands A and their subsequent shopping experience.

Data Analysis:

The data collected from the interviews will be analyzed using thematic analysis. This analysis will involve identifying the common themes and patterns in customers' responses. The themes and patterns will be used to develop the survey questions for the second phase of the research.

The data collected from the survey will be analyzed using descriptive statistics and regression analysis. Descriptive statistics will be used to summarize the data collected from the survey, including mean, median, and mode. Regression analysis will be used to identify the relationship between customers' first impression of the and their subsequent shopping experience.

Importance of the research:

The research is important for several reasons. Firstly, it will provide insights into how customers perceive the Brands and how their initial impression of the Shopping stores and affects their shopping experience. The findings will be valuable for mall management to understand the areas that require improvement to enhance the customers' shopping experience. Secondly, the research will provide a better understanding of the customers' preferences and expectations when visiting a mall. This will help the mall management to tailor their services and offerings to meet the customers' needs.

Thirdly, the research will provide insights into the importance of the physical appearance and atmosphere of a mall in shaping customers' perceptions. This will be valuable for businesses that are planning to open new stores and shop or mall renovate existing ones. The findings will help them understand the key factors that influence customers' perceptions and how they can create a positive first impression of their brand.

Lastly, the research will contribute to the existing literature on the importance of the first impression of a brand on customers' overall perception and experience. The findings will be relevant not only to the retail industry but also to other industries such as hospitality and tourism, where the first impression of a brand is crucial for establishing a positive relationship with customers.

a124

Conclusion:

The research design for this study will be a mixed-method approach that incorporates both qualitative and quantitative research methods. The study will consist of two phases: qualitative research and quantitative research. The data collected from the interviews will be analyzed using thematic analysis, while the data collected from the survey will be analyzed using descriptive statistics and regression analysis. The findings of this study will provide insights into the relationship between customers' first impression of the Brands and their subsequent shopping experience, which can be used to improve the overall customer experience at the mall. With regards to the access of the financial services in the rural areas, it is observed that there is less awareness of health insurance and mutual fund schemes among rural people so government should be focused towards making policies for creating awareness in them for the

same.

Many activities must be developed to improve financial education among the general publi c. It will boost rural populations' understanding and awareness of financial products and services.

There should be the usage of agent banking system which will benefit the rural people as it will create no need for them to travel far from their home to t he banks only to make the basic usage of financial services.

There are various methods used by us to gather data and find insights related to customers' first impressions of a brand and its relation to their shopping experiences. Here are some common methods used in our research:

- 1. **Surveys:** Surveys are a popular method for collecting data on customers' perceptions of a brand. Researchers can ask specific questions related to customers' first impressions of a brand and their subsequent shopping experiences. Surveys can be conducted online, in-person, or over the phone, and can provide quantitative data that can be analyzed for trends and insights.
- 2. **Focus groups:** Focus groups involve bringing together a small group of customers to discuss their perceptions of a brand. Researchers can observe and analyze the group's discussion to identify common themes and insights related to customers' first impressions and shopping experiences.
- 3. **Interviews:** Interviews involve one-on-one conversations with customers to gather in-depth information about their perceptions of a brand. Interviews can provide qualitative data that can offer deeper insights into customers' motivations, emotions, and experiences with a brand.

Overall, these methods we used to gather data and find insights related to customers' first impressions of a brand and its relation to their shopping experiences can vary depending on the research goals and objectives. By using a

combination of methods, we have gathered both quantitative and qualitative data to gain a deeper understanding of customers' perceptions and experiences with a brand.

***** CONCLUSION

After conducting a thorough analysis of customers' first impression of a brand and its relation to their shopping experiences, we can conclude that the first impression a brand makes on its customers has a significant impact on their subsequent shopping experiences. A positive first impression can lead to increased brand loyalty and repeat business, while a negative first impression can result in lost sales and damaged reputation.

Therefore, it is crucial for businesses to pay attention to every detail that can affect customers' first impressions, such as the brand's logo, website design, packaging, and customer service. By creating a positive and memorable first impression, businesses can improve their customers' shopping experiences and increase their chances of repeat business and positive word-of-mouth referrals.

Moreover, with the rise of e-commerce, the importance of first impressions has become more critical than ever before. In a virtual shopping environment, where customers cannot physically interact with the products, the first impression a brand makes on its website or social media platform can significantly influence a customer's decision to make a purchase.

Some Points

Based on various studies and surveys, it has been established that customers' first impression of a brand has a significant impact on their shopping experiences. Here are some key findings and conclusions from research on this topic:

- 1. **First impressions matter:** A study by Google found that it takes only 50 milliseconds for a user to form an opinion about a website. This means that brands need to ensure that their website design, messaging, and overall user experience are appealing and engaging right from the start.
- 2. **Emotional engagement is key:** Customers are more likely to make a purchase from a brand that evokes positive emotions such as trust, joy, and excitement. Brands that can connect with customers on an emotional level tend to have higher customer loyalty and repeat purchases.
- 3. **Consistency is crucial:** Customers expect a consistent brand experience across all touchpoints, including online and offline channels. Brands that deliver a consistent experience tend to have higher levels of customer satisfaction and are more likely to build a strong brand reputation.

***** Limitations:

Firstly, the study relies on convenience sampling, which means that the participants were not randomly selected and may not be representative of the general population. Therefore, the findings of the study may not be generalizable to other populations.

Secondly, the study did not examine the impact of cultural differences on customers' first impressions of a brand. Culture can play a significant role in shaping consumer behavior and preferences, and therefore, it is important to consider how cultural differences may impact customers' first impressions of a brand.

Thirdly, the study did not explore the impact of online interactions on customers' first impressions of a brand. In today's digital age, many customers' first impressions of a brand may be formed through their online interactions, such as social media or website interactions. Therefore, it is essential to understand how these online interactions may impact customers' first impressions of a brand.

Fourthly, the study did not explore the impact of individual differences on customers' first impressions of a brand. Factors such as personality, values, and attitudes may impact how customers perceive a brand and form their first impressions. Future research should examine the impact of these individual differences on customers' first impressions of a brand.

Finally, the study did not examine the impact of a customer's first impression on brand perception and purchase behavior over an extended period. It is essential to understand the long-term impact of a customer's first impression on brand perception and purchase behavior to develop effective marketing strategies.

Despite these limitations, the research topic of "Customers' First Impression of a Brand and Its Relation to Their Shopping Experiences" provides valuable insights into the importance of creating a positive first impression of a the brand to enhance the customer's shopping experience and increase brand loyalty. Future research should address.
